WinXP SP1 = today's Society: a wonky* Metaphor

(* schief, schwach, wackelig)

our analogy:

Microsohoft $\hat{=}$ **mankind**

(point of view)

2002 $\hat{=}$ **2007**

(point in time at which we have something that
partly works but has its shortcomings)

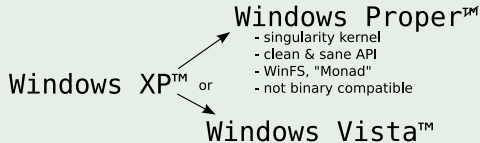

Windows XP SP1 $\hat{=}$ **democracy & market economy**

(our product)

Possible “M\$-Ex-Future” Scenarios.. and the outcome.

M\$'s options in 2002:

their decision:

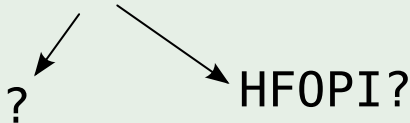

After being postponed several times, Microsoft released Windows™ Vista™ to the wild on January 30th 2007, with several promised features cut because “some 10,000 Microsoft Corp. workers” (according to BusinessWeek) could not get them to work. . . . Since then, many users are complaining about its inefficient use of resources, lack of flexibility and annoying usability issues.

The Decision to be made..

Our options as a civilization in 2008:

current political system
(democracy + free market economy)

our decision:

?

good reasons to start from scratch:

freedom to design:

- many of the constraints for change gone (except laws of nature.. & murphy)
- chance for more target-directed topology (efficiency = $\frac{\text{output}}{\text{resources needed}}$)
- learn from experience: avoid making the same silly mistakes
- if you deprecate the craft you don't have to fix old bugs

- Thank you for listening!
- poll about how YOU look at the future
